JEUDI 29 JANVIER 2026 / 11h30 **Carola FLORES FERNÁNDEZ**, Archaeologist and Professor at the History and Social Science Department, Universidad Adolfo Ibañez, Chile

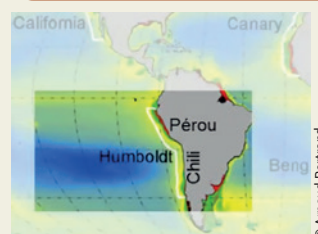

Archaeological records on marine resource use along the Northern coast of Chile, hyperarid sector of the Humboldt current

Along the coast of Chile there are thousands of archaeological sites with a rich and complex record of people's daily life. Remains of all types of coastal and marine resources can be found in these cultural deposits that were used as food, construction and raw materials for tools and ornaments. Kelp, marine shells and bones of fish, birds and marine mammals compound the assemblages of these sites. Due to the great predominance of marine shells, these archaeological sites are called shell middens and are located all along the thousands of kilometers of Chilean coastlines. They have an antiquity that goes back to 12000 years B.P., which evidences a long tradition of marine and coastal fishing, hunting and gathering. Withing this context, fruitful interdisciplinary research has been done studying the long-term dynamics and interconnection between ecological and social processes. The presentation will review some examples of these investigations and the reconstructed patterns of fish, mollusk and kelp use through millennia.
